20-05-06**Log Event A****Borehole Information**

Farm : <u>B</u>	Tank : <u>B-105</u>	Site Number : <u>299-E33-218</u>
N-Coord : <u>45,290</u>	W-Coord : <u>52,655</u>	TOC Elevation : <u>653.69</u>
Water Level, ft :	Date Drilled : <u>5/31/1973</u>	

Casing Record

Type : <u>Steel-welded</u>	Thickness, in. : <u>0.280</u>	ID, in. : <u>6</u>
Top Depth, ft. : <u>0</u>	Bottom Depth, ft. : <u>120</u>	

Borehole Notes:

Borehole 20-05-06 was drilled in May 1973 to a depth of 120 ft and was completed with 6-in. casing. Data from the drilling log and Chamness and Merz (1993) were used to provide borehole construction information. These references do not indicate that the borehole casing was perforated or grouted. The casing thickness is presumed to be 0.280 in., on the basis of the published thickness for schedule-40, 6-in. steel tubing.

Equipment Information

Logging System : <u>1B</u>	Detector Type : <u>HPGe</u>	Detector Efficiency: <u>35.0 %</u>
Calibration Date : <u>02/1997</u>	Calibration Reference : <u>GJO-HAN-14</u>	Logging Procedure : <u>P-GJPO-1783</u>

Logging Operation Notes:

This borehole was logged by the SGLS in five log runs. Four log runs were required to log the borehole. An additional log run was performed to repeat an interval of the borehole as a quality check. The top of the borehole casing, which is the zero reference for the SGLS, is approximately 1.5 ft above the ground surface. The total logging depth achieved was 119.5 ft.

Analysis Information

Analyst : E. LarsenData Processing Reference : MAC-VZCP 1.7.9Analysis Date : 12/02/1998**Analysis Notes :**

The pre-survey and post-survey field verification for each logging run met the acceptance criteria established for peak shape and system efficiency. The energy calibration and peak-shape calibration from the accepted calibration spectrum that most closely matched the field data were used to establish the peak resolution and channel-to-energy parameters used in processing the spectra acquired during the logging operation.

A casing correction factor for a 0.280-in.-thick steel casing was applied to the concentration data during the analysis process.

Shape factor analysis was applied to the SGLS data and provides insights into the distribution of Cs-137 contamination and into the nature of zones of elevated total count gamma-ray activity not attributable to gamma-emitting radionuclides.

Log Plot Notes:

Separate log plots show the man-made and the naturally occurring radionuclides. The natural radionuclides can be used for lithology interpretations. The headings of the plots identify the specific gamma rays used to calculate the concentrations. Uncertainty bars on the plots show the statistical uncertainties for the measurements as 95-percent confidence intervals. Open circles on the plots give the MDL. The MDL of a radionuclide represents the lowest concentration at which positive identification of a gamma-ray peak is statistically defensible.

A combination plot includes the man-made and natural radionuclides, the total gamma derived from the spectral data, and the Tank Farms gross gamma log. The gross gamma plot displays the latest available digital data. No attempt has been made to adjust the depths of the gross gamma logs to coincide with the

Log Event A

SGLS data.

The interval between 55 and 75 ft was relogged as a quality assurance measure to establish the repeatability of the radionuclide concentration measurements. A separate log plot showing the radionuclide concentrations that were calculated using separate data sets provided by the original and rerun logging runs is included.

A plot of the shape factor analysis results is included. The plot is used as an interpretive tool to help determine the radial distribution of man-made contaminants around the borehole.

A plot of selected historical gross gamma logs from 1980 to 1989 is also included. The plot can be used to help identify any historical changes in gross gamma activity. This plot is included only in the Tank Summary Data Report for tank B-104.

Results/Interpretations:

Detector saturation or very high dead time occurred between 46.5 and 50 ft. As a result, no usable spectral data were collected along this region of the borehole.

The man-made radionuclides Cs-137 and Co-60 were detected around this borehole. The Cs-137 contamination was detected continuously from the ground surface to 15.5 ft, from 18.5 to 24 ft, 44.5 to 46.5 ft, and from 50 ft to the bottom of the logged interval. Two small zones of Cs-137 contamination were detected between 18.5 and 24 ft. Isolated concentrations of Co-60 were detected between 106 and 110 ft. A single occurrence of Co-60 was detected at a depth of 117 ft.

The K-40 and Th-232 concentrations are absent between 46.5 and 50 ft. Most of the U-238 concentration values are absent between 44.5 and 63 ft. The K-40 concentrations increase from 38.5 to 41.5 ft and remain elevated to the bottom of the logged interval.

Additional information and interpretations of log data are included in the main body of the Tank Summary Data Reports for tanks B-104 and B-105.
